Evaluation of effectiveness of parecetamol in reducing pain and morphine consumption in patients undergoing laparoscopic cholecystectomy surgery

Protocol summary

Summary

The aim of this study is evaluation of the effect of paracetamol on reducing pain after laparoscopic cholecystectomy surgery. Inclusion criteria : ASA class I ; Age between 18- 50 years.In this prospective double blind randomized study 30 patient were divided in intervention and control group . Exclusion Criteria : Operation less than one hour or more than three hours ; intraoperative bleeding more than 6 ml/kg ; liver or kidney disease ; addiction , alcoholism , ; patient reluctance to participate in the study . In intervention group 10 minutes after induction of anesthesia 1gr Paracetamol in 100ml of 0.9% NaCl was injected intravenously over 15 minutes . In the control group 10 minutes after induction of anesthesia 100 cc 0.9% NaCl was injected intravenously over 15 minutes. pain was recorded at extubation, 15 minutes , 30 minutes , one, two, three, four, five and six hours after extubation based on visual analog score. opioid consumption was recorded after surgery.

Scientific title

Evaluation of effectiveness of parecetamol in reducing pain and morphine consumption in patients undergoing laparoscopic cholecystectomy surgery

Public title

Analgesic effect of paracetamol after laparoscopic cholecystectomy surgery

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion Criteria : ASA class I ; Age between 18- 50 years Exclusion Criteria : Operation less than one hour or more than three hours ; intraoperative bleeding more than 6 ml/kg ; liver or kidney disease ; addiction ;

alcoholism ; patient reluctance to participate in the study

Age
From **18 years** old to **50 years** old

Gender
Both

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **30**

Randomization (investigator's opinion)

Health conditions studied

1

Description of health condition studied
Pain

ICD-10 code
R52.0

ICD-10 code description
Acute Pain

Primary outcomes

1

Description
Postoperative Pain

Timepoint
0 minute, 15 minutes , 30 minutes, 1 , 2 , 3 , 4 , 5 and 6 hours after extubation

Method of measurement
Visual Analogue Scale

Secondary outcomes

1

Description
Nausea and Vomiting

Timepoint
After six hours of extubation

Method of measurement
Frequency

Intervention groups

1

Description
In intervention group 10 minutes after induction of anesthesia 1gr Paracetamol in 100ml of 0.9% NaCl was injected intravenously over 15 minutes

Category
Prevention

2

Description
In the control group 10 minutes after induction of anesthesia 100 cc 0.9% NaCl was injected intravenously over 15 minutes.

Category
Prevention
