Comparing the effectiveness of hypnosis and muscle relaxation exercises in symptom relief of premenstrual syndrome

Protocol summary

Summary

This study is aimed to assess the effectiveness of hypnosis in symptom relief of premenstrual syndrome and comparison with muscle relaxation exercises. Study population are 30 females referred to the two hospitals affiliated to Babol University of Medical Sciences who have premenstrual syndrome according to premenstrual syndrome screening scale and not to have exclusion criteria in baseline psychiatric visit. These 30 patients will be allocated randomly in two case (intervention) and control groups. 15 patients in case group will be under a standardized course of hypnotherapy included 6 weekly sessions of hypnosis (duration of each session: almost 30 minutes). In 15 patients of control group, six sessions of muscle relaxation exercises will be educated weekly. Hypnosis and muscle relaxation exercises will be carried out by a psychiatrist, faculty member, who has passed training course of hypnosis and has certificate of participation in this course. The status of the patients in both two groups will be evaluated in the first and third months after treatment with premenstrual symptoms screening and severity tool.
